PROFESSIONAL OVERVIEW

Full-stack Software Engineer with 3+ years of experience modernizing and supporting web applications using Angular, C#/.NET Web API, and SQL Server. Transitioned from an accounting background after developing a passion for automation through Excel formulas, macros, and reporting, now focused on building secure, high-performance systems that streamline workflows and free time for what matters most. Known for strong troubleshooting, performance optimization, and end-to-end ownership in delivering reliable, production-ready solutions.

EDUCATION

- General Assembly Software-Engineering Bootcamp (Dec 2021)
- Multiverse Software Engineering Bootcamp Certificate (In Progress)

WORK EXPERIENCE

Software Engineer

HP Inc | 2025 – present

- Led the modernization of a legacy line-of-business platform by migrating it to an Angular SPA with a separated .NET backend, improving performance and UX while lowering the long-term cost of ownership through cleaner architecture and easier maintenance.
- Built reusable Angular components and standardized form workflows, pairing them with validated .NET Web API endpoints and consistent error contracts to reduce rework, speed up delivery, and improve stakeholder trust in system behavior.
- Optimized T-SQL queries and stored procedures and managed schema migrations to reduce latency and support stable, repeatable production releases.
- Drove reliability improvements through defensive coding, standardized HTTP patterns, and targeted refactoring of legacy service boundaries—reducing incident risk and making issues faster to diagnose for engineering and support teams.
- Implemented automated tests across Angular and .NET to prevent regressions, reduce manual verification effort, and enable safer deployments with fewer rollbacks.

Software Engineer

General Assembly | Sep 2021 – Dec 2021

- Built full-stack applications using HTML5, CSS3, JavaScript, Python, and frameworks such as Node.js, Express.js, React, and Django.
- Applied MVC/MVT patterns, RESTful architecture, and Agile practices while integrating PostgreSQL, MongoDB, and Firebase.
- Used Git/GitHub, VS Code, and Postman for version control, debugging, and API testing.

Credit Controller

S3 | Jan 2023 – Dec 2024

- Ensured billing accuracy by processing invoices, resolving discrepancies, and validating internal/external reports using advanced Excel tools (XLOOKUP/VLOOKUP).
- Improved reporting efficiency through account reconciliations and automated Excel workflows (formulas, macros), reinforcing a focus on process optimization that led to transitioning into software engineering.

PROJECTS

Inventory Application - Delivered an end-to-end inventory CRUD workflow with a RESTful Express API and relational persistence, translating backend contracts into a responsive React UI. Improved usability with mobile-first UI polish and maintained team velocity through consistent formatting and test/debug discipline.

DrivingEd-App - Designed and shipped a full-stack scheduling platform in .NET (SQL Server + EF Core + Web API + Blazor), modeling users/appointments with migrations, seed data, and environment-based configuration. Implemented real booking workflows with validated forms and reliable UI↔API integration across local and hosted environments.

EchoPlay - Architected a scalable Angular app with routing/guards, service-based state, and a polished discovery UX (search, new releases, deep-linked player, theming). Integrated authenticated workflows end-to-end (token handling, protected routes, favorites + history) and stabilized the codebase with Jest unit tests.

EchoPlay-API - Built a production-style ASP.NET Core API that federates identity via Spotify, issues JWTs, and enforces authorization on user-scoped endpoints. Strengthened data integrity with EF Core + SQL Server constraints (uniqueness, deduplication, delete behaviors) to keep favorites, categories, and history consistent under real usage.

Pixel Forge - Implemented a secure cross-domain auth flow using Steam OpenID + server sessions, handling real deployment constraints like credentialed CORS and hardened cookie settings. Containerized frontend/backend with Docker and shipped repeatable CI/CD (tests → build → image → deploy) for reliable automated releases.
